

PROBLEM

Mistletoe seeds are easy to germinate but adult plants occur on a restricted range of hosts. Is this because seeds never get deposited on other plants? Or if seeds do arrive on other plants, how big does the hopeful mistletoe grow before it is prevented from attaching?

INFORMATION

1. The common mistletoe *Amyema preissii* is found mainly on *Acacia* but also on *Cassia* and *Eucalyptus*.
2. Seed can be collected from March-July and will not germinate if the fruit is ~~seMr~~ ~~AMCID 10>>~~ BDC BT1 014.97 (
